## Report

It is often difficult to perceive the value of things until their service is at hand. Perhaps the same is true and can be said per the significance and utility of the Internet Applications class within the Library and Information Technician Program.

The class has brought us many new aptitudes, abilities and points of confidence to enjoy. In a library setting, knowledge of and a competency with HTML, CSS and JavaScript will provide an applicant or worker with extra abilities and points of distinction to separate them from their peers. The ability to change a colour on a webpage, to update the terms of service or to change the times on a schedule are basic tasks that none the less require an expertise to accomplish. As we now have this expertise while others potentially do not, it is something of tremendous value.

This class also provides the confidence necessary to achieve anything. The challenges are successive and generous, in that they condition you to approach new things with the certainty that all can be accomplished through hard work even if the subject is one you have never seen before.

In summation, the Internet Applications class within the Librarian and Information Technician program provides students with a founded personal confidence and specialized professional ability.
